

VELORA ONLINE STORE

*A report of the main project work submitted in partial fulfillment of
the requirements for the award of Degree of*

BACHELOR OF COMPUTER APPLICATIONS

Submitted By

ANJANA RENJITH

Reg. No: 230021078756

Under the guidance of **Ms. SURABHI KURIAN, MCA**
(Assistant Professor, Department of Computer Science)

Department of Computer Science

**MAR AUGUSTHINOSE COLLEGE,
RAMAPURAM**

(Affiliated to Mahatma Gandhi University)

Ramapuram-686576

2023-2026

MAR AUGUSTHINOSE COLLEGE RAMAPURAM

(Affiliated to Mahatma Gandhi University)

CERTIFICATE

This is to certify that this Project work entitled “**VELORA ONLINE STORE**” is a bonafide report of the main project done by **Ms. ANJANA RENJITH (RegNo:230021078756)** during the academic year 2025-2026 for the partial fulfillment for the award of the Degree of Bachelor of Computer Applications from Mahatma Gandhi University, Kottayam.

Mr. Sunil K Joseph, MSc
Head of the Department

Ms. Surabhi Kurian, MCA
Assistant Professor

Viva-voce Examination conducted on..... at
Mar Augusthinose College, Ramapuram

Internal Examiner

External Examiner

DECLARATION

I, **ANJANA RENJITH**, hereby declare that the project work entitled “**VELORA ONLINE STORE**” is a record of bonafide project carried out by me under the supervision and guidance of **Ms. SURABHI KURIAN, MCA**, Assistant Professor, Department of Computer Science, Mar Augusthinose College, Ramapuram. I also declare that it has not been previously submitted for the award of any Degree, Diploma or similar titles by any University or similar other institutions.

Place : Ramapuram

ANJANA RENJITH

Date:

ACKNOWLEDGEMENT

Firstly, I thank **God Almighty**, whose blessings were always with me and helped me to complete this project work successfully.

I acknowledge my deepest gratitude to **Dr. Reji Varghese Mekkaden**, principal for permitting me to do this project.

I express my sincere and profound thanks to **Mr. Sunil K Joseph**, Head of the Department of Computer Science, for giving me an opportunity to do this project.

I express my greatest gratitude to **Ms. Surabhi Kurian**, Assistant Professor, Mar Augusthinose College, Ramapuram for her valuable guidance and encouragement for completing this project.

Words are boundless to express my gratitude to all the faculty and members of the Computer Science Department for their timely help and support.

I wish to extend my grateful thanks to **Mr. Ditto Joseph** Computer Programmer and System Administrator for his technical support, valuable advice and guidance throughout the project.

I wish to extend my grateful thanks to Management and staff, of **Mar Augusthinose College, Ramapuram**, for their valuable support to carry out this project work.

Finally, I express my deep appreciation to all my friends and family members for the moral support and encouragement they have given to complete this project successfully.

ANJANA RENJITH

ABSTRACT

“Velora Online Store” is a modern and efficient e-commerce web application for bags, developed to provide users with a secure, intuitive, and convenient online shopping experience. The primary objective of the system is to enable customers to browse a wide range of bag categories, access detailed product descriptions and pricing information, add products to a shopping cart, and place orders securely. The user-side functionalities include customer registration, login authentication, cart management, and order placement, ensuring a smooth and personalized shopping journey.

The system also incorporates a powerful Admin Panel that allows administrators to manage the overall operations of the platform. Admin functionalities include comprehensive product management, such as adding, editing, updating, and deleting products, along with user management and order tracking. This ensures effective control over inventory, customer activity, and order processing.

The **frontend** of **“Velora Online Store”** is developed using **HTML**, **CSS**, and **JavaScript**, **Bootstrap**, providing a responsive and visually appealing interface. The **backend** is implemented using **Python with the Django framework**, which ensures secure authentication, efficient data handling, and scalable application performance. **SQLite** is used as the **database** to reliably store and manage user, product, and order data.

Overall, **“Velora Online Store”**, demonstrates the practical implementation of modern e-commerce concepts by integrating frontend design, backend development, and database management into a complete and functional system. The project emphasizes usability, security, and scalability, making it suitable for small- to medium-scale online retail businesses.

INTRODUCTION

1 INTRODUCTION

1.1 SOFTWARE INTRODUCTION

Velora Online Store is a modern and user-friendly **e-commerce web application for bags**, designed to offer customers a convenient and enjoyable online shopping experience. The platform enables users to explore a wide range of bags, including handbags, backpacks, travel bags, and sling bags, all from the comfort of their own homes. Velora focuses on combining attractive design with efficient functionality to ensure a smooth and satisfying purchasing process.

The system allows customers to browse products by category, view detailed product descriptions, compare prices, and make secure purchases. With an intuitive interface and responsive design, Velora Online Store ensures ease of use for users across different devices. The platform is built to simplify the online shopping journey while offering high- quality products and reliable service.

Key features of Velora Online Store include:

- **Easy Browsing:** Users can conveniently browse bags through well-organized categories and search options to quickly find products that match their preferences.
- **User-Friendly Interface:** The website is designed with simplicity and clarity, ensuring smooth navigation and an enhanced user experience.
- **Secure Shopping:** Secure login and order placement features help protect user data and ensure safe transactions.
- **Cart Management:** Customers can add, update, or remove items from their shopping cart before placing orders.

Velora Online Store aims to serve as a centralized platform for bag shopping, catering to diverse styles, needs, and occasions while ensuring customer satisfaction.

1.2 BACKGROUND AND MOTIVATION

BACKGROUND

With the rapid growth of e-commerce, online shopping has become a preferred choice for customers due to its convenience and accessibility. Bags are essential fashion and utility accessories used by people of all age groups, creating a strong demand for a reliable online platform that offers variety, quality, and ease of purchase.

- **Market Demand:** Bags are widely used for daily, travel, and professional purposes. An online platform allows customers to access a wide range of designs, brands, and styles in one place.
- **Efficiency:** Traditional shopping methods can be time-consuming. An e-commerce system simplifies the process by enabling users to browse, compare, and purchase products quickly.
- **Accessibility:** Velora Online Store allows customers to shop anytime and from anywhere, eliminating geographical limitations.
- **User Experience:** A well-structured website with detailed product information enhances customer satisfaction and decision-making.
- **Data Management:** The system efficiently manages products, users, and orders, reducing manual work and improving accuracy.

- **Security and Trust:** Secure authentication and controlled access help build trust between users and the platform.

MOTIVATION

- **Convenience:** Velora Online Store provides a single platform where customers can explore, select, and purchase bags easily without physical store visits.
- **Transparency:** Clear product descriptions, pricing details, and images help users make informed purchasing decisions.
- **Technology Integration:** The use of modern web technologies enhances performance, security, and interactivity.
- **Scalability:** The platform is designed to support future expansion, including new product categories and additional features.

The primary objective of the **Velora Online Store** project is to develop a **secure, scalable, and user- friendly** e-commerce website that simplifies the online bag-shopping experience. By integrating effective frontend design, robust backend functionality, and efficient database management, Velora Online Store aims to deliver a reliable digital shopping solution while demonstrating practical implementation of modern e-commerce technologies.

SYSTEM STUDY

2 SYSTEM STUDY

2.1 SYSTEM STUDY

System study is a comprehensive analysis of various operations and their interrelationships both within and outside a system. It is the foundation of system development and plays a vital role in understanding existing processes, identifying limitations, and defining user and system requirements.

For the **Velora Online Store** for Bags, the system study focuses on analyzing customer interactions, administrative workflows, and data management processes. The study helps in understanding how users browse products, manage carts, and place orders, as well as how administrators handle product listings, user accounts, and order tracking. This analysis ensures the development of a secure, efficient, and user-friendly e-commerce platform.

- **Fact-Finding Techniques:**

Fact-finding techniques are systematic methods used by system analysts to collect accurate and relevant information about system requirements. For the **Velora Online Store** project, the following techniques were adopted:

- **Record Review:**

Record review involves examining existing documents and records that provide valuable insights into organizational operations. In the **Velora Online Store** project, records such as product catalogs, sales data, user registration details, and order histories from similar e-commerce platforms were analyzed. This review helped in understanding standard e-commerce

workflows, data organization methods, and best practices for managing online retail systems.

- **Observation:**

Observation enables analysts to gather first-hand information by directly studying how activities are carried out. For **Velora Online Store**, observation was conducted by analyzing how users interact with existing bag-shopping websites. This included observing browsing patterns, cart usage, and checkout processes. The insights gained helped design an intuitive interface and ensure a smooth and efficient user experience.

- **Interview:**

Interviews were conducted with potential users and individuals familiar with online shopping platforms. These discussions helped identify customer expectations, common challenges faced during online shopping, and preferred system features. In addition, insights from individuals with administrative experience helped define requirements related to inventory management and order processing. Interviews proved to be one of the most effective methods for understanding real-world system needs.

2.2 EXISTING SYSTEM

The existing system for purchasing bags largely depends on traditional retail stores or basic online platforms with limited functionality. Customers often need to visit physical stores to check product availability, compare prices, and make purchases, which can be time-consuming and inconvenient.

Inventory and sales records are often maintained manually or using simple systems, leading to inefficiencies and a higher possibility of errors. Customers do not have access to real-time updates on product availability,

new arrivals, or order status. Additionally, shopping is restricted to store operating hours, limiting flexibility for customers.

These challenges highlight the need for a modern digital solution that offers centralized management, real-time updates, and enhanced customer engagement.

2.3 PROPOSED SYSTEM

The proposed **Velora Online Store** for Bags is a feature-rich digital platform designed to transform the online shopping experience for both customers and administrators.

- **Customer Features**

Customers can register and log in securely to browse a diverse collection of bags categorized by type, style, and purpose. The system allows users to view detailed product descriptions, pricing information, and images, add items to a shopping cart, and place orders securely. Customers can also track their orders and view purchase history, ensuring transparency and convenience throughout the shopping process.

- **Admin Features**

The administrator serves as the backbone of the **Velora Online Store** platform. Admins can efficiently manage product listings by adding, editing, updating, or deleting items. They can monitor user accounts, track orders, manage inventory levels, and ensure smooth system operation. The admin panel reduces manual workload, improves data accuracy, and provides complete control over platform activities.

By integrating these advanced features, **Velora Online Store** enhances operational efficiency, reduces errors, and delivers a secure, scalable, and user-friendly e-commerce solution. The system effectively meets the demands of modern online retail businesses while providing customers with a seamless and enjoyable shopping experience.

SYSTEM ANALYSIS

3 SYSTEM ANALYSIS

3.1 INTRODUCTION

Software Engineering involves the systematic analysis, design, development, testing, and maintenance of software systems. To develop software accurately and efficiently, a well-defined software engineering process must be followed. System analysis is a detailed study of the various operations performed by a system and the relationships among its modules. It provides a structured approach to problem-solving during the development of a new system.

For the **Velora Online Store** for Bags, system analysis focuses on studying the existing shopping methods, identifying system objectives, and understanding user and administrative requirements. This phase involves collecting information from all stakeholders who interact with or are affected by the system. Data is gathered regarding system inputs, outputs, decision points, and transactions handled by the system.

The primary aim of the **Velora Online Store** system is to provide an efficient, secure, and user-friendly automated shopping platform. Therefore, system analysis is performed with great precision to identify limitations of existing methods and define the exact requirements of the proposed system. The system is studied as a whole, tracing how inputs are processed and transformed into meaningful outputs.

3.2 STAKEHOLDERS IN THE PROJECT

Stakeholders are individuals or groups who have an interest in the system and are affected by its operation. The major stakeholders involved in the **Velora Online Store** project are customers and the administrator.

3.2.1 CUSTOMER

Customers are the primary users and key stakeholders of the Velora Online Store system. The platform is designed to make online bag shopping simple, convenient, and secure. Customers can register and log in to the system, browse various bag categories, view detailed product descriptions and pricing, and add items to the shopping cart. Once products are selected, customers can place orders securely and view their order details. These features enhance customer satisfaction and provide a smooth online shopping experience.

3.2.2 ADMIN

The administrator plays a central role in managing and maintaining the Velora Online Store system. There is a single admin responsible for overseeing all system activities. The admin monitors user activity, manages product listings, and ensures the smooth functioning of the platform. Administrative responsibilities include adding, updating, editing, and deleting products, managing user accounts, and tracking customer orders. The admin also ensures data accuracy, resolves system issues, and maintains platform security.

3.3 FEASIBILITY STUDY

Feasibility study evaluates the proposed system in terms of its practicality, efficiency, and impact on users and resources. The feasibility analysis for Velora Online Store examines whether the system can be developed and implemented successfully.

The key feasibility considerations include:

- Technical Feasibility
- Economic Feasibility
- Operational Feasibility

TECHNICAL FEASIBILITY

Technical feasibility assesses whether the existing hardware and software technologies are sufficient to support the proposed system. Velora Online Store is developed using industry-standard technologies such as HTML, CSS, JavaScript, Bootstrap, Python (Django), and SQLite. These technologies are reliable, widely supported, and compatible with existing systems. No additional hardware or specialized software is required, making the system technically feasible. The development team has the required skills, and the technologies used are mature and stable.

ECONOMIC FEASIBILITY

Economic feasibility evaluates the cost-effectiveness of the proposed system. Velora Online Store significantly reduces manual effort in product management, order processing, and record keeping. The use of open-source technologies minimizes development and maintenance costs. The system improves efficiency, saves time, and reduces errors, leading to long-term benefits. Intangible benefits such as improved customer satisfaction, trust, and business reputation further justify the economic feasibility of the system.

OPERATIONAL FEASIBILITY

Operational feasibility determines whether the system will be accepted and used effectively by users. Velora is designed with a simple and intuitive interface, ensuring ease of use for both customers and

administrators. The system does not face resistance from users, as it improves accessibility and efficiency. Information can be accessed quickly, and operations are streamlined, making the system operationally feasible.

3.4 SOFTWARE DEVELOPMENT LIFECYCLE MODEL

The Software Development Life Cycle (SDLC) defines the stages involved in developing, deploying, and maintaining software. SDLC provides a structured approach to software development, ensuring quality and reliability. Various SDLC models exist, including Waterfall, Prototype, Spiral, Agile, and Iterative models.

For the **Velora Online Store** project, the Iterative Enhancement Model is used.

3.4.1 ITERATIVE ENHANCEMENT MODEL

The Iterative Enhancement Model focuses on developing the system in small increments. Each iteration delivers a working version of the software, and new features are added gradually based on feedback. This approach allows continuous improvement, early identification of issues, and flexibility in accommodating changes.

ADVANTAGES

- Active user involvement at every stage.
- Early detection and resolution of issues.
- Flexible and adaptable to changes.

3.5 HARDWARE AND SOFTWARE REQUIREMENTS

3.5.1 SOFTWARE SPECIFICATION

This project is built upon the latest technology software.

- Frontend: HTML, CSS, JavaScript, Bootstrap
- Backend: Python (Django Framework)
- Database: SQLite
- Web Server: Django's Built-in Development server (for testing)
- Operating System: Windows 11

3.5.1.1 PYTHON (DJANGO FRAMEWORK)

Python with the Django framework is used for backend development. Django follows the Model-View-Template (MVT) architecture, enabling clean separation of logic, data, and presentation. It provides built-in features such as authentication, admin panel, ORM, and security mechanisms. Django ensures scalability, rapid development, and maintainability, making it ideal for the Velora e-commerce system.

3.5.1.2 HTML, CSS, JAVASCRIPT, BOOTSTRAP

HTML structures the web pages, CSS enhances visual design, JavaScript adds interactivity, and Bootstrap ensures responsiveness and consistency across devices. Together, these technologies create a user-friendly and visually appealing interface for both customers and administrators.

3.5.1.3 SQLite

SQLite is a lightweight relational database used to store and manage application data. It integrates seamlessly with Django ORM and requires no

separate server configuration. SQLite efficiently handles product details, user information, and order records, making it suitable for small- to medium-scale applications like Velora Online Store.

3.5.1.4 DJANGO'S BUILT-IN DEVELOPMENT SERVER

Django provides a built-in development server that allows developers to test and debug the application during development. It enables real-time preview of changes and testing of features such as product listing, user authentication, and order management before deployment.

3.5.1.5 PYCHARM

PyCharm is an advanced Integrated Development Environment (IDE) for Python development. It offers features like intelligent code completion, debugging, version control integration, and Django support. PyCharm improves developer productivity and simplifies project management for the Velora Online Store application.

3.5.2 HARDWARE REQUIREMENTS

The selection of hardware configuring is a very task related to the software development, particularly inefficient RAM may affect adversely on the speed and corresponding on the efficiency of the entire system. The processor should be powerful to handle all the operations. The hard disk should have the sufficient to solve the database and the application. Hardware used for development:

CPU	:	Intel i5 Processor
-----	---	--------------------

Memory	:	8 GB RAM
Cache	:	6 MB
Hard Disk	:	256GB SSD or 1TB HDD
Monitor	:	15.6"
Keyboard	:	Any
Mouse	:	Any

Minimum Hardware Required for Implementation:

CPU	:	Intel Core 2 Duo
Memory	:	2GB or Above
Cache	:	2 MB or Above
Hard Disk	:	20 GB or Above
Monitor	:	Any
Keyboard	:	Any
Mouse	:	Any

SYSTEM DESIGN

4 SYSTEM DESIGN

System design involves the detailed design of the system selected in the system study phase.

4.1 INPUT DESIGN

Input design is the process of converting user-oriented inputs into a computer-based format that can be processed efficiently by the system. In the Velora e-commerce website, input design plays a vital role in ensuring accurate data collection, ease of use, and secure transactions.

The system accepts input from users through interactive web forms such as registration, login, product selection, cart management, and order placement. These inputs are captured through well-designed input screens developed using HTML, CSS, JavaScript, and Bootstrap, ensuring a user-friendly and responsive interface.

Proper validation checks are implemented at every stage of data entry to minimize errors and maintain data integrity. Mandatory fields, format validations (such as email and phone number), and password rules are enforced. If incorrect or incomplete data is entered, the system generates appropriate error messages and guides the user to correct the input.

Input to the system is done through secure form submission and mapped to the backend using Django views and models. Menu-driven navigation and clear input forms help users easily browse products, add items to the cart, and complete purchases. On the admin side, input forms are provided for product management, category management, and order updates, ensuring smooth and controlled system operations.

Overall, the input design of Velora Online Store ensures accuracy,

security, and simplicity, reducing processing errors and enhancing the user experience.

4.2 OUTPUT DESIGN

Output design focuses on presenting processed information to users in a clear, meaningful, and useful format. In the Velora Online Store, outputs are designed to support both customers and administrators in decision-making and transaction tracking.

For users, the system provides outputs such as product listings, product details (including images, prices, and descriptions), cart summaries, order confirmations, and order history. These outputs are displayed in an organized and visually appealing manner to enhance readability and user satisfaction. Confirmation messages and notifications are generated after successful registration, login, and order placement.

For administrators, the output includes product reports, user details, order status reports, and inventory information. These outputs help administrators monitor sales, manage stock, and track customer activities efficiently. The system also allows generating permanent records of orders and transactions for future reference.

The output screens are designed to be responsive and consistent across devices. Proper formatting, tables, and messages are used to ensure clarity. Thus, the output design of Velora improves system usability, strengthens user interaction, and supports effective management of the e-commerce platform.

4.3 DATABASE DESIGN

A database is a collection of interrelated data stored with minimum redundancy to serve many users quickly and efficiently. The general objective is to make information access easy, quick, inexpensive, and flexible

for the users. The general theme behind a database is to integrate all information. Database design is recognized as a standard of management information system and is available virtually for every computer system.

In the Velora Online Store e-commerce website for bags, the database is used to store and manage information related to users, products, orders, and administrative activities. In database design, several specific objectives are considered:

- Ease of learning and use
- Controlled redundancy
- Data independence
- Accuracy and integrity

A database is an integrated collection of data and provides centralized access to the data. Usually, the centralized data managing software is called RDBMS. The main significant difference between RDBMS and other DBMS is the separation of data as seen by the program and data that has direct access to the storage device. This difference is known as logical and physical data separation.

4.3.1 NORMALIZATION

Designing a database is a complex task, and normalization theory is a useful aid in the design process. The process of normalization is concerned with the transformation of a conceptual schema into a computer-representable form. In the Velora Online Store system, the database is expected to grow by adding new attributes and new relations. Data may be used in new ways, and tuples may be added, deleted, or updated. In such situations, the performance of a database entirely depends upon its design.

A poorly designed database may lead to certain undesirable situations such as:

- Repetition of information
- Inability to represent certain information
- Loss of information

To minimize these anomalies, normalization is used. If the database is in a normalized form, the data can grow without forcing the rewriting of application programs in most cases. This is important because of the excessive and increasing cost of maintaining an organization's application programs and data.

As the quality of application programs increases, the cost of maintaining them without normalization will rise to prohibitive levels. A normalized database can also support many related activities of an organization, thereby minimizing the need for rewriting application programs. Thus, normalization helps achieve a good database design and ensures continued efficiency of the database.

Normalization theory is built around the concept of normal forms. A relation is said to be in a normal form if it satisfies a specified set of constraints. For example, a relation is said to be in First Normal Form (1NF) if it contains only atomic values. Thus, every normalized relation is in 1NF.

Codd defined the first three normal forms. All normalized relations are in 1NF, some 1NF relations are also in 2NF, and some 2NF relations are also in 3NF. Relations in 3NF are more desirable than those in 1NF or 2NF. Therefore, the database designer should prefer 3NF.

The normalization procedure states that a relation in a given normal form can be converted into a set of relations in a more desirable normal form. This procedure involves successive reduction of relations into improved forms. This process is reversible and ensures that no information is lost. Hence, it is also referred to as lossless decomposition.

First Normal Form

A relation is said to be in First Normal Form if all its attributes are based on a single domain. The objective of normalizing a table into 1NF is to remove repeating groups and ensure that each field contains only a single value.

Second Normal Form

A table is said to be in Second Normal Form when it is in 1NF and every attribute in the record is functionally dependent on the whole primary key and not just a part of it.

Third Normal Form

A table is said to be in Third Normal Form when it is in 2NF and every non- key attribute is functionally dependent only on the primary key.

RULES FOR NORMALIZATION

Rule 1: There should be a one-to-one relationship between the instances of an entity and the rows of the table.

Rule 2: A field should have the same meaning in each row of the table.

Rule 3: Each table should represent at most one entity.

Rule 4: Multiple instances of an entity should be represented by multiple rows in a table.

Rule 5: Joins should be based only on primary and foreign-key equality.

Rule 6: Ensure that keys are linked correctly to maintain data integrity.

4.4 TABLES

A table is a collection of data related to a particular subject, stored in rows and columns. **Rows are called records and columns are called fields.** Data entered through input forms is stored in backend database tables using proper linking. Information from multiple tables can be combined and displayed as output.

1. Table Name:userreg

Field Name	Data Type	Constraint	Description
id	AutoField	Primary Key, Not Null	Unique identifier for the user record
name	CharField(100)	Not Null	Name of the user
email	CharField(100)	Not Null	Email address
phone	CharField(10)	Not Null	Phone number
adhar	CharField(15)	Not Null	Aadhaar number
photo	ImageField	Not Null	User photo
uname	CharField(100)	Not Null	username
pword	CharField(100)	Not Null	Password
rights	CharField(10)	DEFAULT'U'	User role or rights

2. Table Name:product

Field Name	Data Type	Constraint	Description
id	AutoField	Primary Key, Not Null	Unique product identifier
bname	CharField(150)	Not Null	Brand name
cname	CharField(150)	Not Null	Collection name
mtype	CharField(150)	Not Null	Material type
color	CharField(150)	Not Null	Colour of the product
category	CharField(150)	Not Null	Category of the product
size	CharField(150)	Not Null	Size of the product
price	IntegerField	Not Null	Price of the product
stock	IntegerField	Not Null	Available stock quantity
photo	ImageField	Not Null	Product image

3. Table Name:cart

Field Name	Data Type	Constraint	Description
id	AutoField	Primary Key, Not Null	Unique cart item record identifier
pid	IntegerField	Foreign Key, Not Null	Product Id
pcode	CharField(100)	Not Null	Product Code
pname	CharField(100)	Not Null	Product Name
price	IntegerField	Not Null	Product Price
no	IntegerField	Not Null	Quantity
tot	IntegerField	Not Null	Total amount
photo	CharField(100)	Not Null	Product image

4. Table Name:sales

Field Name	Data Type	Constraint	Description
id	AutoField	Primary Key, Not Null	Unique record identifier for the sale
salesno	IntegerField	Not Null	Invoice or sales number
sdate	DateField	Not Null, Default Today	Date of the sale
fname	CharField(100)	Not Null	Buyer's first name
lname	CharField(100)	Not Null	Buyer's last name
email	CharField(100)	Not Null	Buyer's email address
address	CharField(100)	Not Null	Shipping address
city	CharField(100)	Not Null	Buyer's city
country	CharField(100)	Not Null	Buyer's country
zipcode	CharField(20)	Not Null	Postal or ZIP code
telephone	CharField(10)	Not Null	Buyer's contact number
samt	IntegerField	Not Null	Toatal sales amount
paymode	CharField(100)	Not Null	Payment method used

buyerid	IntegerField	Foreign Key, Not Null	Reference to userreg table ID
buyer	CharField(100)	Not Null	Username of the buyer
status	CharField(50)	Not Null,Default 'New Order'	Order status

5. Table Name:salssub

Field Name	Data Type	Constraint	Description
id	AutoField	Primary Key, Not Null	Unique record identifier
salesno	IntegerField	Foreign Key, Not Null	Reference to sales table salesno
pname	CharField(100)	Not Null	Name of the purchased product
price	IntegerField	Not Null	Unit price of the product
no	IntegerField	Not Null	Quantity purchased
tot	IntegerField	Not Null	Total amount for this line item

6. Table Name:review

Field Name	Data Type	Constraint	Description
id	AutoField	Primary Key, Not Null	Unique identifier for the review

pid	IntegerField	Foreign Key, Not Null	Reference to product table id
name	CharField(100)	Not Null	Name of the reviewer
rating	IntegerField	Not Null	Rating given by the reviewer
message	TextField	Not Null	Review text/comment body
created_at	DateField	Not Null, Default Today	Date the review was submitted

4.5 DATA FLOW DIAGRAM

Data Flow Diagram is a network that describes the flow of data and processes that change, or transform, data throughout the system. This network is constructed by use a set of symbols that do not imply a physical implementation. It is a graphical tool for structured analysis of the system requirements. DFD models a system by using external entities from which data flows to a process, which transforms the data and creates, output-data-flows which go to other processes or external entities or files. Data in files may also flow to processes as inputs.

There are various symbols used in a DFD. Bubbles represent the processes. Named arrows indicate the data flow. External entities are represented by rectangles. Entities supplying data are known as sources and those that consume data are called sinks. Data are stored in a data store by a process in the system. Each component in a DFD is labelled with a descriptive name. Process names are further identified with a number.

The Data Flow Diagram shows the logical flow of a system and defines the boundaries of the system. For a candidate system, it describes the

input (source), outputs (destination), database (files) and procedures (data flow), all in a format that meet the user's requirements.

The main merit of DFD is that it can provide an overview of system requirements, what data a system would process, what transformations of data are done, what files are used, and where the results flow.

This network is constructed by use a set of symbols that do not imply a physical implementation. It is a graphical tool for structured analysis of the system requirements. DFD models a system by using external entities from which data flows to a process, which transforms the data and creates, output-data-flows which go to other processes or external entities or files. External entities are represented by rectangles. Entities supplying data are known as sources and those that consume data are called sinks. Data are stored in a data store by a process in the system. It is a graphical tool for structured analysis of the system requirements. DFD models a system by using external entities from which data flows to a process, which transforms the data and creates, output-data-flows which go to other processes or external entities or files. Data in files may also flow to processes as inputs.

Rules for constructing a Data Flow Diagram

- Arrows should not cross each other
- Squares, circles and files must bear names.
- Decomposed data flow squares and circles can have same time
- Choose meaningful names for data flow
- Draw all data flows around the outside of the diagram

4.5.1 Basic Data Flow Diagram Symbols

Data Flow Diagram Symbols

	A data flow is a route, which enables packets of data to travel from one point to another. Data may flow from a source to a process and from data store or process. An arrow line depicts the flow, with arrow head pointing in the direction of the flow.
	A source or sink is a person or part of an organization, which enters or receives information from the system, but is considered to be outside the context of data flow model
	Circles stands for process that converts data in to information. A process represents transformation where incoming data flows are changed into outgoing data flows.
	A data store is a repository of data that is to be stored for use by a one or more process may be as simple as buffer or queue or sophisticated as relational database. They should have clear names. If a process merely uses the content of store and does not alter it, the arrowhead goes only from the store to the process. If a process alters the details in the store, then a doubleheaded arrow is used.

4.5.2 DATA FLOW DIAGRAM

Each component in a DFD is labelled with a descriptive name. Process name is further identified with number. Context level DFD is draw first. Then the process is decomposed into several elementary levels and is represented in the order of importance. A DFD describes what data flow (logical) rather than how they are processed, so it does not depend on hardware, software, and data structure or file organization.

First Level DFD for Admin

First Level DFD for User

SYSTEM TESTING

5 SYSTEM TESTING

5.1 TESTING PROCEDURES

Software testing plays a critical role in the successful development and deployment of **Velora Online Store**, an e-commerce website designed for online bag shopping. The primary objective of system testing is to ensure that the application functions accurately, reliably, and securely according to the specified requirements. Testing helps in identifying defects, validating system behavior, and ensuring a smooth and error-free user experience.

The testing process for **Velora Online Store** begins at the individual module level and gradually progresses to full system testing. Each feature is tested using carefully designed test cases to verify correctness, performance, and usability. Functional testing ensures that all user-side and admin-side operations work as expected, while non-functional testing evaluates performance, responsiveness, and security. By executing structured testing procedures with appropriate test data, the system's reliability and quality are enhanced. This phase ensures that **Velora Online Store** is ready for real-world usage and provides a seamless, efficient, and user-friendly online shopping experience for customers while maintaining effective administrative control.

5.2 TESTING METHODOLOGIES

The **Velora Online Store** e-commerce platform undergoes multiple testing methodologies to evaluate its functionality, integration, data validation, security, and overall system performance. The following testing techniques are applied during development and before deployment:

UNIT TESTING

Unit testing focuses on testing individual components or modules of the **Velora Online Store** system independently. Each unit is tested with predefined inputs, and the outputs are compared against expected results to verify correctness. This testing ensures that each module performs its intended function in isolation. For **Velora Online Store**, unit testing includes validating key features such as user registration, login authentication, product listing, category browsing, cart operations, and order placement. Admin-side modules such as product addition, updating product details, and order management are also tested individually. Unit testing helps detect errors at an early stage, reduces debugging effort, and improves code quality and maintainability.

INTEGRATION TESTING

After successful unit testing, integration testing is performed to verify the interaction between different modules of the **Velora Online Store** system. This phase ensures that combined components work together seamlessly without data inconsistencies or functional conflicts.

Integration testing validates workflows such as user login combined with product browsing, adding items to the cart followed by checkout, and order confirmation linked with inventory updates. On the admin side, it ensures smooth interaction between order processing, payment verification, and inventory management. This testing helps identify issues that may arise due to module dependencies and ensures cohesive system behavior.

VALIDATION TESTING

Validation testing ensures that all user inputs are checked against defined constraints before being accepted by the system. This testing

enhances data accuracy, usability, and system security.

In the **Velora Online Store** platform, validation testing includes verifying email formats during registration, enforcing strong password rules, validating contact numbers, and ensuring mandatory fields are not left empty. Product-related validations, such as price limits and stock availability, are also tested. Proper validation prevents incorrect data entry, improves user experience, and protects the system from invalid or malicious inputs.

SYSTEM TESTING

System testing evaluates the complete **Velora Online Store** application as a whole after successful integration of all modules. This testing is performed using a black-box approach to verify whether the system meets all functional and non-functional requirements.

During system testing, end-to-end scenarios such as user registration, product browsing, cart management, order placement, and admin order tracking are tested thoroughly. Performance aspects like page load time, responsiveness, and security checks are also evaluated. This phase ensures that the system behaves correctly in real-world conditions and meets quality standards before deployment.

USER ACCEPTANCE TESTING

User Acceptance Testing is the final phase of testing, conducted to confirm that the **Velora Online Store** system satisfies user and stakeholder requirements. This testing is carried out using real-world scenarios and data by potential users and administrators.

Customers test features such as navigation, ease of ordering, and clarity of product information, while administrators verify product management, order tracking, and system control functions. Successful

completion of UAT confirms that the system is user-friendly, reliable, and ready for live implementation.

In conclusion, comprehensive testing at multiple levels—unit testing, integration testing, validation testing, system testing, and user acceptance testing—ensures the successful implementation of the **Velora Online Store** e-commerce website for bags. This structured testing approach enhances system reliability, security, and usability while minimizing errors and performance issues. As a result, **Velora Online Store** emerges as a robust, efficient, and dependable e-commerce solution capable of meeting the demands of modern online retail businesses.

IMPLEMENTATION AND MAINTENANCE

6 IMPLEMENTATION AND MAINTENANCE

SYSTEM IMPLEMENTATION

The implementation phase marks the transformation of Velora Online Store from a conceptual design into a fully functional e-commerce web application. This phase involves deploying the system in a real-world environment and ensuring that all components operate efficiently as intended. Proper planning and execution during implementation are essential to minimize risks and ensure a smooth transition from development to live usage.

Key implementation activities include configuring the backend environment using the Django framework, integrating the frontend developed with HTML, CSS, JavaScript, and Bootstrap, and setting up the SQLite database for secure data storage. Product data, user records, and order information are carefully structured and migrated into the system to ensure accuracy and consistency.

Training plays an important role during implementation. Administrators are trained to manage product listings, handle customer accounts, and track orders efficiently through the admin panel. System validation is carried out to ensure that reports, transactions, and user interactions function correctly. The primary objective of this phase is to deliver a stable, reliable, and user-friendly e-commerce platform with minimal disruption.

A well-planned implementation strategy ensures that Velora integrates seamlessly into operational use, offering customers a smooth shopping experience while enabling administrators to manage the platform effectively.

SYSTEM MAINTENANCE

System maintenance begins immediately after implementation and continues throughout the system's lifecycle to ensure long-term efficiency, reliability, and adaptability. Maintenance activities in Velora Online Store are essential for keeping the platform responsive to changing user needs and technological advancements.

Maintenance for Velora Online Store is categorized into the following types:

Corrective Maintenance: Corrective maintenance focuses on identifying and resolving issues that arise after deployment. This includes fixing bugs, correcting logical errors, resolving performance issues, and addressing unexpected system failures. Prompt corrective actions help maintain system stability and user trust.

Adaptive Maintenance: Adaptive maintenance involves modifying the system to accommodate changes in business requirements, user expectations, or technological updates. Examples include adding new bag categories, integrating updated payment methods, or enhancing security features to align with evolving industry standards.

Perfective Maintenance: Perfective maintenance aims at improving system performance and usability. This includes optimizing database queries, enhancing the user interface, improving page load speed, and implementing feedback-based improvements to enhance customer satisfaction.

By following a structured maintenance approach, Velora Online Store remains scalable, secure, and efficient over time. Continuous monitoring and timely updates ensure that the system adapts to future business growth and maintains its relevance in the competitive e-commerce market.

The successful implementation and ongoing maintenance of Velora Online Store ensure that it operates as a reliable and modern e-commerce solution for bag retail. Through careful deployment, effective training, and structured maintenance practices, the system achieves long-term stability, improved performance, and enhanced user satisfaction. This approach enables Velora Online Store to evolve alongside technological advancements and customer expectations, ensuring sustained success.

FUTURE SCOPE OF THE PROJECT

7 FUTURE SCOPE OF THE PROJECT

The Velora Online Store e-commerce website for bags has been designed with scalability and adaptability in mind. As user expectations and e-commerce technologies continue to evolve, several enhancements can be incorporated in the future to improve functionality, customer engagement, and overall system efficiency. These upgrades will ensure that the platform remains competitive, modern, and aligned with emerging digital commerce trends.

Future development of Velora Online Store will mainly focus on automation, personalization, advanced technologies, and enhanced user experience. Such improvements fall under perfective maintenance, which involves refining existing features and introducing new capabilities to meet growing business and customer demands.

•**User Notification System** – A real-time notification system can be introduced to inform users about order confirmations, shipping updates, delivery status, discounts, and promotional offers. Notifications via email, SMS, or in-app alerts will improve communication and customer engagement.

•**Personalized Product Recommendations** – A recommendation engine can be developed to suggest bags based on user preferences, browsing history, and past purchases. This feature will enhance product discovery, improve user satisfaction, and increase sales conversions.

•**AI-Based Chatbot Support** – An AI-powered chatbot can be integrated to assist customers with product inquiries, order status, and support requests, ensuring 24/7 customer service.

•**Order Tracking and Return Management** – Real-time order tracking and easy return/refund management features can be added to enhance transparency and trust.

CONCLUSION

8CONCLUSION

The Velora Online Store for bags has successfully achieved its primary objective of providing a modern, efficient, and user-friendly online shopping platform for both customers and administrators. By replacing traditional and manual shopping methods, Velora Online Store offers a streamlined digital solution that simplifies product browsing, order placement, and inventory management.

The system enables customers to conveniently explore various bag categories, view detailed product descriptions and prices, manage their shopping cart, and place orders securely. At the same time, the admin panel provides effective control over product listings, user accounts, and order tracking, reducing administrative workload and improving operational efficiency.

By utilizing modern web technologies such as HTML, CSS, JavaScript, Bootstrap, Python (Django framework), and SQLite, the platform ensures secure data handling, reliable performance, and scalability. The integration of authentication mechanisms and structured data management enhances both system security and user trust.

Velora Online Store is designed with flexibility in mind, allowing for future enhancements such as personalized product recommendations, real-time notifications, advanced analytics, and mobile application support. Regular maintenance and updates will further improve system performance and user experience.

In conclusion, Velora Online Store stands as a reliable, scalable, and efficient e-commerce solution tailored for bag retail businesses. The project demonstrates the practical application of full-stack web development concepts and successfully delivers a platform that enhances customer satisfaction while simplifying business operations for administrators.

2. ABOUT US

Designed for the Modern Icon

Velora Luxury didn't start in a boardroom. It started in a small atelier with a single piece of premium leather and a vision, to create bags that don't just carry your essentials, but carry your personality.

We believe that luxury should be accessible yet exclusive. Every curve, every stitch, and every silver clasp is designed for people who appreciate the finer things in life but need them to work in the real world.

PURE MATERIALS

We only use the highest grade of leathers and sustainable components, ensuring your Velora bag lasts for decades, not just seasons.

MASTER CRAFT

Each bag is architected by master artisans who have spent years perfecting the balance between weight, durability, and aesthetics.

GLOBAL TRANSIT

Our designs are tested for the global traveler. Light enough for the airport, stylish enough for the gala, and strong enough for the journey.

Every Stitch Tells a Promise

We don't mass produce. We compose. Each Velora Luxe piece comes with a lifetime commitment to quality and style.
